

MUDSKIPPER

Periophthalmus argentilineatus

Fascinating brackish water fish that prefers habitat both above and below water (only partially fill the aquarium and aquascape to provide habitat extending above water level). Mudskippers also usually eat above water so place their food in a small shallow dish positioned above the water level.

Disclaimer: The information provided here is of a general nature only. There are site specific factors that are not addressed here that may also affect the health and well being of your fish, as such Coburg Aquarium will not be held liable for the performance of your fish.
